Narrative Summary

Classification

Reach B3 is 4.3 miles long and located in east Billings. The reach is characterized by the loss of several miles of side channel, extensive Russian olive infestation, and substantial flow alterations due to human influences.

In total there are about 13,500 feet of bank armor in Reach B3, which covers almost 30 percent of the bankline. Most of the armor is rock riprap, although there are over 3,000 feet of flow deflectors mapped in the reach, as well as over a mile of floodplain dikes.

Prior to 1950, 11,000 feet of side channels had been blocked in the reach, and since that time another 14,000 feet have been similarly blocked by small dikes. These ~4 miles of blocked channel are about equivalent in length to that of the main river. That said, as of 2001 there were still about 35,000 feet of active side channel in Reach B3.

Solid waste dumps were mapped on old side channels on the east floodplain areas at RM 361.5 and RM 360.6. There is one major headgate on the left bank of the river that feeds a heavily armored canal at RM 359.9.

Flow alterations and channel blockages have promoted the encroachment of riparian vegetation into old channel areas. Since 1950, almost 200 acres of riparian vegetation colonized previously un-vegetated side channels. Floodplain turnover rates have gone down since 1976 by about 2 acres per year, indicating slower rates of erosion.

Since 1950, predominantly agricultural land uses in Reach B3 have been converted to a mix of agriculture and urban/exurban development. About 1,000 acres of urban/exurban development has taken place since 1950. About 470 acres of ground continues to be flood irrigated in this area of east Billings. Approximately 16 percent of the Channel Migration Zone has become restricted due to physical features, all of which are bank armor installations designed to protect urban/industrial and agricultural land uses.

About 50 acres of Russian olive have been mapped in Reach B3. There are also fairly extensive mapped wetlands, with about 230 acres of total wetland area mapped, 95 acres of which are emergent wet meadows and marsh areas.

Reach B3 was sampled as part of the fisheries study. A total of 29 fish species were sampled in the reach, and none of those species have been identified by the Montana Natural Heritage Program as a Species of Concern (SOC).

Reach B3 was sampled as part of the avian study. The average species richness in this reach was 7.5, which indicates the average number of species observed during site visits to the reach in cottonwood habitats. The average species richness for sites evaluated is 8. One bird species identified by the Montana Natural Heritage Program as Potential Species of Concern (PSOC) was also found, the Plumbeous Vireo.

A hydrologic evaluation of flow depletions indicates that flow alterations over the last century have been substantial in this reach. The mean annual flood is estimated to have dropped from 23,900 cfs to 19,800 cfs, a drop of about 17 percent. The 2-year flood, which strongly influences overall channel form, has dropped from 44,500 cfs to 40,100 cfs, which is a reduction of 10 percent. Low flows have also been impacted; severe low flows described as 7Q10 (the lowest average 7-day flow anticipated every ten years) for summer months has dropped from an estimated 2,920 cfs to 2,010 cfs with human development, a reduction of 31 percent. More typical summer low flows, described as the summer 95% flow duration, have dropped from 3,836 cfs under unregulated conditions to 2,227 cfs under regulated conditions at the Billings gage, a reduction of 42 percent.

CEA-Related observations in Reach B3 include:

- •Riparian encroachment with flow alterations
- Extensive armoring with CMZ encroachment

Recommended Practices (may include Yellowstone River Recommended Practices--YRRPs) for Reach B3 include:

- •Side channel reactivation at RM 362.0, 360.5, 359.8 and RM 359.0
- •Russian olive removal
- •Solid waste dump removal RM 361.5 and RM 360.6
- •Irrigation diversion structure management at RM 359.9.

HYDROLOGIC SUMMARY

Hydrologic data available for the Reach Narratives include data from representative gaging stations, modeling from the COE from the Big Horn river upstream, and modeling by the USGS for the Big Horn River to the Missouri River confluence. Gaging stations that best represent the watershed area within any reach are used to describe the flood history within the reach. Hydrology modeling results generated for all reaches provides unregulated and regulated flow values. Seasonal and annual flow duration data generated by the USGS are available for reaches C10 through D13.

PHYSICAL FEATURES

Several efforts to capture the types and extents of physical features in the corridor have been generated by the CEA study. The 2001 Physical Features Inventory was performed through helicopter/video Rapid Aerial Assessment by the NRCS (NRCS, 2001) and did not include Park County. This inventory includes point and linear features that represent bank armor, irrigation structures, transportation encroachments, and areas of accelerated erosion. Bank armor mapped in the 2001 inventory only reflects features on the active channel margin, and thus excludes off-channel features on historic side channels. Some floodplain restriction features such as dikes and levees in the 2001 Physical Features Inventory may extend well beyond the active channel. In 2013, the 2001 inventory was revised to include Park County. At that time, some attribute inconsistencies in the original data were addressed. This dataset was then updated to reflect conditions in the 2011 NAIP imagery.

For Stillwater, Yellowstone and Dawson Counties, a Physical Features Timeline was generated that includes additional mapping based on aerial photography and assigns approximate dates of feature construction based on observed presence/absence in historic imagery between the 1950s and 2005 (DTM and AGI, 2008). The Physical Features Timeline contains features that were not mapped in the 2001 inventory (e.g. bank armor abandoned in floodplain areas by 2001). As such the total bank armor extent in the 2005 data is commonly greater than that identified in 2001 or 2013.

Note: As the goal for each physical features mapping effort were different, with differing mapping extents, there will be descrepancies between total feature lengths (e.g. length of rock riprap) in each data set.

2001 and 2011 Physical Features Bankline Inventories

ICE JAMS

Ice jam data were obtained from the National Ice Jam Database maintained by the Ice Engineering Group at Army Corps of Engineers Cold Regions Research and Engineering Laboratory (https://rsgis.crrel.usace.army.mil/icejam/). From this database, Yellowstone River ice jams are summarized by reach in the Yellowstone River Historic Events Timeline (DTM and AGI, 2008b). The basic information for each ice jam is presented as a list of events. The graph represents the number of database entries for a reach. Note that a single jam event may have multiple entries.

GEOMORPHIC

The geomorphology data presented below consist of measured changes in Braiding Parameter since 1950 and blocked side channels. Braiding parameter is a measure of the total length of side channels relative to that of the main channel. The braiding parameter is calculated as the sum of anabranching and primary channel lengths divided by the primary channel length. Secondary channels within the bankfull margins are a function of flow stage and hence were not included in the braiding parameter calculation. If a reach has a braiding parameter of 3, then the total bankfull channel length is three times that of the main channel. The mean braiding parameter measured for all 88 reaches is 1.8.

Blocked side channels that were either plugged with a small dike or cutoff by larger features such as a levee or road prism were identified for the pre and post-1950s eras.

Additional geomorphic parameters are discussed in more detail in the study report and appendices.

Braiding (Bankfull)	Primary Chan. Length (ft)	Anab. Ch. Length (ft)	Bankfull Braiding Parameter		% Change in Braiding
1950	22,668	41,147	2.82	1950 to 1976:	-21.52%

Thursday, March 3, 2016 Page 7 of 15

HYDRAULICS

Available hydraulic information includes county-based HEC-RAS modeling efforts by the Army Corps of Engineers with the exclusion of Park County. Floodplain modeling was performed for four conditions representing a developed and undeveloped floodplain, and unregulated and regulated flows for the 1.5, 2, 5, 10, 20, 50, 100, 200, and 500-year events. Park County has limited FEMA hydraulic modeling and was not included in the analysis.

The results of HEC-RAS modeling for the 5 and 100-year flood events were assessed to compare the extents of inundated area for the pristine (undeveloped floodplain, unregulated flows) and developed (developed floodplain, regulated flows) conditions. The data sets provided for each flow condition were unioned in the GIS to identify areas where the inundated extent differed. These area areas of human-caused floodplain isolation due to either flow alterations or physical features such as levees. For the 100-year flood event, isolated areas greater than 5 acres were attributed with the interpreted reason for isolation (railroad, levee, etc.). The resulting values are presented as acres and percent of the pristine floodplain that has been isolated. The pristine floodplain is defined as the total floodplain footprint minus the area of the mapped 2001 bankfull channel (mapped islands were included in the floodplain area).

Floodplain Isolation	100-	-Year	5-Year			
•	Isolated Acres	% of Floodplain	Isolated Acres	% of Floodplain		
Non-Structural (hydrology, geomorphic, etc.)	0	0.0%				
Agriculture (generally relates to field boundaries)	0	0.0%				
Agriculture (isloated by canal or large ditch)	0	0.0%				
Levee/Riprap (protecting agricultural lands)	0	0.0%				
Levee/Riprap (protecting urban, industrial, etc.)	0	0.0%				
Railroad	0	0.0%				
Abandoned Railroad	0	0.0%				
Transportation (Interstate and other roads)	0	0.0%				
Total Not Isolated (Ac)	1640		1489			
Total Floodplain Area (Ac)	1640		1644			
Total Isolated (Ac)	0	0.0%	155	14.1%		

The 5-year floodplain is a good allegory for the extent of the riparian zone. Thus, irrigated areas within the 5-year floodplain tend to represent riparian zones that have been converted to agrigulture and may result in additional bank protection to protect the agricultural production and irrigation infrastructure.

	Flood	Sprinkler	Pivot	Total

Mean 50-Yr

A series of Channel Migration Maps were developed for the Yellowstone River from Gardiner to its mouth in McKenzie County, North Dakota (Thatcher, Swindell, and Boyd, 2009). These maps and their accompanying report can be accessed from the YRCDC Website. The channel migration zone (CMZ) developed for the Yellowstone River is defined as a composite area made up of the existing channel, the historic channel since 1950 (Historic Migration Zone, or HMZ), and an Erosion Buffer that encompasses areas prone to channel erosion over the next 100 years. Areas within this CMZ that have been isolated by constructed features such as armor or floodplain dikes are attributed as "Restricted Migration Areas" (RMA). Beyond the CMZ boundaries, outlying areas that pose risks of channel avulsion are identified as "Avulsion Potential Zones".

LAND USE

Land uses were mapped from aerial photography Gardiner to the confluence of the Missouri River in North Dakota for four time periods: 1950s, 1976, 2001, and 2011. Mapping was performed at approximately 1:6,000 to ensure consistent mapping across all data sets. Typically, if a feature could not be easily mapped at the target mapping scale, it was not separated out from the adjacent land use.

A four-tiered system was used to allow analysis at a variety of levels. Tier 1 breaks land use into Agricultural and Non-Agricultural uses. Tier two subdivided uses into productive Agricultural Land and Infrastructure for the Agricultural land, and Urban, Exurban and Transportation categories for the Non-Agricultural land. Tier three further breaks down land uses into more refined categories such as Irrigated or Non-Irrigated and Residential, Commercial, or Industrial. Finally, Tier 4 focuses primarily on the productive agricultural lands, identifying the type of irrigation (Pivot, Sprinkler or Flood).

RIPARIAN

Riparian mapping data are derived from the Yellowstone River Riparian Vegetation Mapping study (DTM/AGI 2008). This study coarsely mapped the riparian vegetation communities using 1950's, 1976-1977, and 2001 aerial imagery in a GIS environment. The polygons are digitized at a scale of approximately 1:7,500, with a minimum mapping unit of approximately 10 acres. The goal of the delineation was to capture areas of similar vegetation structure as they appeared on the aerial imagery, while maintaining a consistent scale.

The "Riparian Turnover" values quantify the total area within the active channel area that converted from either woody vegetation to open bar or water, or from open bar or water to woody vegetation. A comparison of these values allows some consideration of overall riparian encroachment into the river corridor from 1950 to 2001.

Riparian Mapping

-		Shrub (Acres)			Closed Timber (Acres)			Open Timber (Acres)		
Statistic	1950	1976	2001	1950	1976	2001	1950	1976	2001	
Min	4.4	0.5	1.0	1.6	1.4	1.2	0.7	2.6	1.7	
Max	74.7	195.9	173.6	147.6	90.2	152.0	91.3	42.9	89.2	
Average	29.4	13.8	22.3	29.9	20.3	32.7	20.9	17.8	36.0	
Sum	205.9	385.2	356.1	448.2	507.7	523.3	292.9	106.5	179.9	

Riparian Turnover

Conversion of riparian areas to channel, or from channel to riparian between the 1950's and 2001 data set.

Riparian to Channel (acres) 156.7

Channel to Riparian (acres) 214.1

Riparian Encroachment (acres)

57.3

Riparian Recruitment

Creation of riparian areas between 1950s and 2001.

1950s Channel Mapped as 2011 Riparian (Ac) 216.9 1950s Floodplain Mapped as 2011 Channel (Ac) 138.0

Total Recruitment (1950s to 2011)(Ac) 355.0

WETLANDS

Wetland areas were mapped to National Wetland Inventory standards by the Montana Natural Heritage Program. Palustrine wetlands within the mapped 100-year inundation boundary were extracted and summarized into four categories: Riverine (Unconsolidated Bottom - UB, Aquatic Bed - AB, and Unconsolidated Shore - US), Emergent - EM, Scrub-Shrub - SS, and Forested - FO.

	Riverine	Emergent	Scrub/Shrub	Forested	Total
Mapped Acres	95.8	94.9	40.5	0.0	231.2
Acres/Valley Mile	25.3	25.0	10.7	0.0	

RUSSIAN OLIVE

Russian olive is considered an invasive species and its presence in the Yellowstone River corridor is fairly recent. As such, its spread can be used as a general indicator of invasive plants within the corridor. It has the added benefit of being easily identified in multi-spectral aerial photography, making it possible to inventory large areas using remote techniques.

In 2011, Natural Resources Conservation Service (NRCS) in Bozeman, MT conducted an inventory of Russian olive locations in the Yellowstone River watershed. This study utilized the Feature Analyst extension within ArcGIS to interpret multi-spectral 2008 NAIP imagery for the presence of Russian olive. The resulting analysis was converted from raster format to a polygon ESRI shape file for distribution and further analysis within a GIS environment.

This work scope was tasked with integrating the resulting Russian olive inventory into the Yellowstone River Conservation Districts Council (YRCDC) Cumulative Effects Assessment (CEA) GIS and associated reach-based database. Additionally, analysis of Russian olive within the corridor was conducted to characterize its distribution in throughout the corridor and its association with other corridor data sets.

	Floodplain	% of	Other	Inside	Inside '50s	Inside 50s
	Area (Ac)	Floodplain	Area (Ac)	RMA (Ac)	Channel (Ac)	Island (Ac)
Russian Olive in Reach	49.76	4.14%	45.71	7.40	11.57	5.58

Species of Concern

Yellowstone River Reach Narratives

FISHERIES SUMMARY

Fisheries data available for the Reach Narratives include low-flow and high-flow habitat mapping of 2001 conditions for 406 miles of river, extending from the mouth upstream to a point approximately 8 miles upstream of Park City. Habitat mapping was performed remotely on the 2001 CIR aerial photography utilizing habitat classifications developed by Montana Fish, Wildlife, and Parks (DTM 2009). Historic habitat mapping using the 1950's imagery is limited to Reach B1 (high-flow) and D9 (low and high-flow).

Fisheries field sampling data have been provided by Ann Marie Reinhold (MSU). In this study, the Yellowstone River from Park City to Sidney was divided into five segments. Within each segment, fish were sampled in reaches modified by riprap ("treatment reaches") and relatively unmodified reaches ("control reaches"). Fish sampling was conducted during summer and autumn of 2009, 2010, and 2011. Boat electrofishing, trammel nets, mini-fyke nets and bag seines were used to collect data from river bends.

Fish presence data is only presented for those reaches that were sampled.

The Low Flow Habitat Mapping followed schema deveoped by Montana Fish Wildlife and Parks to identify key habitat units for certain aquatic species.

Fish Species Observed in Reach/Region

Region	Region	Region	Region
	✓ Flathead chub	Northern redbelly dace	✓ Stonecat
■ Black bullhead	Freshwater drum	Pallid sturgeon	Sturgeon chub
✓ Black crappie	✓ Goldeye	✓ ✓ Pumpkinseed	Sucker species
Blue sucker	✓ Green sunfish	Rainbow trout	Sunfish species
✓ ✓ Bluegill	✓ Lake chub	River carpsucker	
✓ Brook stickleback	✓ Largemouth bass	Rock bass	✓ Western silvery minnow
✓ ✓ Brown trout	✓ Longnose dace	✓ Sand shiner	☐ ☐ White bass
■ Burbot	✓ Longnose sucker	Sauger Sa	✓ White crappie
Catfish species		✓ Shorthead redhorse	✓ White sucker
Channel catfish	✓ Mottled sculpin	Shortnose gar	Yellow bullhead
✓ Common carp	✓ Mountain sucker	Shovelnose sturgeon	✓ Yellow perch
Creek chub	✓ Mountain whitefish	Sicklefin chub	
✓ ✓ Emerald shiner	Northern pike	✓ ✓ Smallmouth bass	
✓ Fathead minnow	Northern plains killifish	Smallmouth buffalo	

Low Flow Fisheries Habitat Mapping 2001 (Acres)

Habitat	Bankfull	Low Flow	% of Low Flow	
Scour Pool	48.5	45.2	5.4%	
Rip Rap Bottom	95.6	52.8	6.3%	
Rip Rap Margin	28.3	13.1	1.6%	
Secondary Channel	40.8	15.5	1.8%	
Secondary Channel (Seasonal)	211.2	126.3	15.1%	
Channel Crossover	116.1	47.6	5.7%	
Point Bar		27.0	3.2%	
Side Bar		44.3	5.3%	
Mid-channel Bar		8.4	1.0%	
Island	296.7	296.7	35.4%	
Dry Channel		160.1	19.1%

AVIAN

Birds were sampled in 2006 and 2007 by Danielle Jones of Montana State University. Point count methods were used at 304 randomly chosen sites in 21 braided or anabranching reaches. Each site was visited multiple times within a season, and sites were visited in both years. Birds were sampled in grassland, shrubland, and cottonwood forest habitats. Additional bird data was collected by Amy Cilimburg of Montana Audubon in summer 2012. High priority areas for data collection were identified with the assistance of the YRCDC Technical Advisory Committee. The Audubon methodology recorded data for a wider variety of bird species relative to the MSU study, including raptors and waterfowl.

Bird Species Observed	in Reach/Region	Species of Concern	Potential Species of Concern
Region	Region	Region	Region
✓ ✓ American Robin	Chipping Sparrow	Killdeer	✓ ✓ Song Sparrow
✓ ✓ American Crow	☐ ✓ Clay-collared Sparrow	Lark Bunting	Spotted Sandpiper
✓ ✓ American Goldfinch	☐ ☐ Cliff Swallow		✓ ✓ Spotted Towhee
American Kestrel	✓ Common Grackle	✓ Lazuli Bunting	Sharp-shinned Hawk
✓ ✓ American Redstart	Common Merganser	✓ Least Flycatcher	Swainson's Thrush
■ Bald Eagle	Common Nighthawk	✓ Mallard	Sandhill Crane
Baltimore Oriole	□ ✓ Common Raven	☐ ☐ Mountain Bluebird	✓ ✓ Tree Swallow
✓ ✓ Barn Swallow	✓ Common Yellowthroat	✓ ✓ Mourning Dove	☐ Turkey Vulture
■ Belted Kingfisher	Cooper's Hawk	✓ ✓ Northern Flicker	Upland Sandpiper
□ ✓ Black-billed Cuckoo	□ ✓ Dickcissel	Orchard Oriole	
✓ ✓ Black-billed Magpie	✓ Downy Woodpecker		✓ ✓ Violet-green Swallow
✓ ✓ Black-capped Chickadee	Eastern Bluebird	Ovenbird	✓ Warbling Vireo
■ Black-and-white Warbler	■ Eastern Kingbird	✓ V Plumbeous Vireo	✓ Western Kingbird
✓ ✓ Black-headed Grosbeak	Eurasian Collared-dove	Red-headed Woodpecker	
✓ ✓ Blue Jay	✓ European Starling	Red-naped Sapsucker	✓ Western Wood-pewee
☐ ☐ Bobolink	✓ ✓ Field Sparrow	Red Crossbill	✓ ✓ White-breasted Nuthatch
□ ✓ Brewer's Blackbird	Franklin's Gull	□ ✓ Ring-necked Pheasant	✓ ✓ White-throated Swift
✓ ✓ Brown-headed Cowbird	Grasshopper Sparrow	Red-tailed hawk	
Brown Creeper	✓ Gray Catbird	□ ✓ Rock Dove	
□ ✓ Brown Thrasher	Great Blue Heron	✓ Red-winged Blackbird	Yellow-bellied Sapsucker
✓ ✓ Bullock's Oriole	Great Horned Owl	✓ ✓ Red-eyed Vireo	Yellow-billed Cuckoo
☐ ✓ Canada Goose	✓ Hairy Woodpecker	Red-breasted Grosbeak	✓ Yellow-breasted Chat
✓ ✓ Cedar Waxwing		Say's Phoebe	Yellow-headed Blackbird
☐ ✓ Chimney Swift	✓ ✓ House Wren	✓ Savannah Sparrow	✓ Yellow Warbler

Reach B3

CULTURAL INVENTORY SUMMARY

The Yellowstone River Cultural Inventory - 2006 documents the variety and intensity of different perspectives and values held by people who share the Yellowstone River. Between May and November of 2006, a total of 313 individuals participated in the study. They represented agricultural, civic, recreational, or residential interest groups. Also, individuals from the Crow and the Northern Cheyenne tribes were included.

There are three particular goals associated with the investigation. The first goal is to document how the people of the Yellowstone River describe the physical character of the river and how they think the physical processes, such as floods and erosion, should be managed. Within this goal, efforts have been made to document participants' views regarding the many different bank stabilization techniques employed by landowners. The second goal is to document the degree to which the riparian zone associated with the river is recognized and valued by the participants. The third goal is to document concerns regarding the management of the river's resources. Special attention is given to the ways in which residents from diverse geographical settings and diverse interest groups view river management and uses. The results illustrate the commonalities of thought and the complexities of concerns expressed by those who share the resources of the Yellowstone River.

Summary of Cultural Views in Region B

The study segment Big Horn to Laurel includes data from the people of one large county, Yellowstone County. Three themes dominate conversations with the four interest groups. One theme focuses on the evolving communities of Yellowstone County, most of which are influenced by the economic success and sheer growth of Billings. The second theme focuses on the evolving relationships that the people have with the river. While traditional agricultural activities continue in the county, many people discuss notions related to urban and residential experiences and how the river becomes an asset that improves one's quality of life as an urban dweller. The third theme involves a complex tangle of pressures and demands that require managerial strategies capable of dealing with a future that has arrived.
