General Location Rosebud/Treasure County Line Length 6.50 mi (10.46 km)

General Comments Rosebud/Treasure County Line

Narrative Summary

Reach C8 is 9.1 miles long and is located on the Rosebud/Treasure County line. It is a Partially Confined Straight reach type, as the river flows straight eastward along the northern bluff line.

There is approximately 4,100 feet of rock riprap in the reach, 800 feet of which was built since 2001. About 6 percent of the total bankline is armored.

Prior to 1950 about 2,300 feet of side channel had been blocked in Reach C8, and since then, floodplain dikes have blocked another 8,500 feet of side channel. Blocked side channels are located at RM 260R and RM 257R. Side channels have also been passively lost; since 1950, there has been a total loss of 2.6 miles of side channel in Reach C8. About four miles of active side channel remain.

About 35 percent of the total 100-year floodplain has become isolated due to human development. Most of the isolation is due to flow alterations. The 5-year floodplain is even more affected; 55 percent of the historic 5-year floodplain is no longer inundated at that frequency. The isolation of the historic 5-year floodplain, due primarily to flow alterations, has been associated with increased development in these areas; currently there are about 240 acres of flood irrigated land within the historic 5-year floodplain. Most of the isolated 5-year floodplain area is occupied by flood irrigated fields south of the river.

Land use is dominated by agriculture, with 342 acres of pivot irrigation development since 1950. There are about 178 acres of flood irrigated land and 12 acres of pivot within the CMZ, and 10 percent of the CMZ is restricted by physical features.

Riparian recruitment analyses show that between 1950 and 2001, there was 193 total acres of riparian colonization in the reach. Taking into account losses due to erosion, there was still a net gain of 94 acres of woody vegetation into the active channel corridor since 1950. This has occurred both on migrating point bars that have become vegetated, as well as within abandoned side channels. The extent of closed timber has increased from 293 acres in 1950 to 604 acres in 2001. There are 43 acres of Russian olive in the reach.

Reach C8 was sampled as part of the fisheries study. A total of 30 fish species were sampled in the reach, including Sauger, which are recognized by the Montana Natural Heritage Program as a Species of Concern (SOC).

Reach C8 was sampled as part of the avian study. A total of 37 bird species were identified in the reach. Two bird species identified by the Montana Natural Heritage Program as Potential Species of Concern (PSOC) were found, the Ovenbird and the Chimney Swift. Reach C8 has seen an increase in the forested area that is at low risk of cowbird parasitism since 1950. At that time, there were 51 acres per valley mile of such forest, and that number increased to 61 acres per valley mile by 2001.

A hydrologic evaluation of flow depletions indicates that flow alterations over the last century have been major in this reach. The 2-year flood, which strongly influences overall channel form, has dropped by 23 percent. Low flows have also been impacted; severe low flows described as 7Q10 (the lowest average 7-day flow anticipated every ten years) for summer months has dropped from an estimated 4,680 cfs to 2,990 cfs with human development, a reduction of 36 percent. More typical summer low flows, described as the summer 95% flow duration, have dropped from 6,150 cfs under unregulated conditions to 3,320 cfs under regulated conditions at Reach C10 downstream where the analysis begins, a reduction of 46 percent.

CEA-Related observations in Reach C8 include:

•Active and passive loss of thousands of feet of side channel

Recommended Practices (may include Yellowstone River Recommended Practices--YRRPs) for Reach C8 include:

- •Side channel reactivation at RM 260R and RM 257R
- •Russian olive removal

HYDROLOGIC SUMMARY

Hydrologic data available for the Reach Narratives include data from representative gaging stations, modeling from the COE from the Big Horn river upstream, and modeling by the USGS for the Big Horn River to the Missouri River confluence. Gaging stations that best represent the watershed area within any reach are used to describe the flood history within the reach. Hydrology modeling results generated for all reaches provides unregulated and regulated flow values. Seasonal and annual flow duration data generated by the USGS are available for reaches C10 through D13.

Thursday, March 3, 2016 Page 4 of 14

PHYSICAL FEATURES

Several efforts to capture the types and extents of physical features in the corridor have been generated by the CEA study. The 2001 Physical Features Inventory was performed through helicopter/video Rapid Aerial Assessment by the NRCS (NRCS, 2001) and did not include Park County. This inventory includes point and linear features that represent bank armor, irrigation structures, transportation encroachments, and areas of accelerated erosion. Bank armor mapped in the 2001 inventory only reflects features on the active channel margin, and thus excludes off-channel features on historic side channels. Some floodplain restriction features such as dikes and levees in the 2001 Physical Features Inventory may extend well beyond the active channel. In 2013, the 2001 inventory was revised to include Park County. At that time, some attribute inconsistencies in the original data were addressed. This dataset was then updated to reflect conditions in the 2011 NAIP imagery.

For Stillwater, Yellowstone and Dawson Counties, a Physical Features Timeline was generated that includes additional mapping based on aerial photography and assigns approximate dates of feature construction based on observed presence/absence in historic imagery between the 1950s and 2005 (DTM and AGI, 2008). The Physical Features Timeline contains features that were not mapped in the 2001 inventory (e.g. bank armor abandoned in floodplain areas by 2001). As such the total bank armor extent in the 2005 data is commonly greater than that identified in 2001 or 2013.

Note: As the goal for each physical features mapping effort were different, with differing mapping extents, there will be descrepancies between total feature lengths (e.g. length of rock riprap) in each data set.

2001 and 2011 Physical Features Bankline Inventories

Feature Class	Feature Type	2001 Length (ft)	% of Bankline	2011 Length (ft)	% of Bankline	2001-2011 Change

ICE JAMS

Ice jam data were obtained from the National Ice Jam Database maintained by the Ice Engineering Group at Army Corps of Engineers Cold Regions Research and Engineering Laboratory (https://rsgis.crrel.usace.army.mil/icejam/). From this database, Yellowstone River ice jams are summarized by reach in the Yellowstone River Historic Events Timeline (DTM and AGI, 2008b). The basic information for each ice jam is presented as a list of events. The graph represents the number of database entries for a reach. Note that a single jam event may have multiple entries.

GEOMORPHIC

The geomorphology data presented below consist of measured changes in Braiding Parameter since 1950 and blocked side channels. Braiding parameter is a measure of the total length of side channels relative to that of the main channel. The braiding parameter is calculated as the sum of anabranching and primary channel lengths divided by the primary channel length. Secondary channels within the bankfull margins are a function of flow stage and hence were not included in the braiding parameter calculation. If a reach has a braiding parameter of 3, then the total bankfull channel length is three times that of the main channel. The mean braiding parameter measured for all 88 reaches is 1.8.

Blocked side channels that were either plugged with a small dike or cutoff by larger features such as a levee or road prism were identified for the pre and post-1950s eras.

Additional geomorphic parameters are discussed in more detail in the study report and appendices.

Braiding (Bankfull)	Primary Chan. Length (ft)	Anab. Ch. Length (ft)	Bankfull Braiding Parameter		% Change in Braiding
1950	34,703	34,247	1.99	1950 to 1976:	-12.94%
1976	33,984	24,802	1.73	1976 to 1995:	-2.02%
1995	34,391	23,896	1.69	1995 to 2001:	-5.54%
2001	34,218	20,560	1.60	1950 to 2001:	-19.43%
Change 1950 - 2001	-485	-13,687	-0.39		
Length of Side		Pre-1950s (ft)	2,323		
Channels Blocked		Post-1950s (ft)	8,494		

Thursday, March 3, 2016 Page 6 of 14

HYDRAULICS

Available hydraulic information includes county-based HEC-RAS modeling efforts by the Army Corps of Engineers with the exclusion of Park County. Floodplain modeling was performed for four conditions representing a developed and undeveloped floodplain, and unregulated and regulated flows for the 1.5, 2, 5, 10, 20, 50, 100, 200, and 500-year events. Park County has limited FEMA hydraulic modeling and was not included in the analysis.

The results of HEC-RAS modeling for the 5 and 100-year flood events were assessed to compare the extents of inundated area for the pristine (undeveloped floodplain, unregulated flows) and developed (developed floodplain, regulated flows) conditions. The data sets provided for each flow condition were unioned in the GIS to identify areas where the inundated extent differed. These area areas of human-caused floodplain isolation due to either flow alterations or physical features such as levees. For the 100-year flood event, isolated areas greater than 5 acres were attributed with the interpreted reason for isolation (railroad, levee, etc.). The resulting values are presented as acres and percent of the pristine floodplain that has been isolated. The pristine floodplain is defined as the total floodplain footprint minus the area of the mapped 2001 bankfull channel (mapped islands were included in the floodplain area).

Floodplain Isolation	100-	-Year	5-Year		
•	Isolated Acres	% of Floodplain	Isolated Acres	% of Floodplain	
Non-Structural (hydrology, geomorphic, etc.)	665	26.8%			
Agriculture (generally relates to field boundaries)	35	1.4%			
Agriculture (isloated by canal or large ditch)	0	0.0%			
Levee/Riprap (protecting agricultural lands)	11	0.5%			
Levee/Riprap (protecting urban, industrial, etc.)	0	0.0%			
Railroad	186	7.5%			
Abandoned Railroad	0	0.0%			
Transportation (Interstate and other roads)	0	0.0%			
Total Not Isolated (Ac)	1581		1172		
Total Floodplain Area (Ac)	2479		1843		
Total Isolated (Ac)	898	36.2%	671	54.9%	

The 5-year floodplain is a good allegory for the extent of the riparian zone. Thus, irrigated areas within the 5-year floodplain tend to represent riparian zones that have been converted to agrigulture and may result in additional bank protection to protect the agricultural production and irrigation infrastructure.

Land Uses within the CMZ (Acres)

A series of Channel Migration Maps were developed for the Yellowstone River from Gardiner to its mouth in McKenzie County, North Dakota (Thatcher, Swindell, and Boyd, 2009). These maps and their accompanying report can be accessed from the YRCDC Website. The channel migration zone (CMZ) developed for the Yellowstone River is defined as a composite area made up of the existing channel, the historic channel since 1950 (Historic Migration Zone, or HMZ), and an Erosion Buffer that encompasses areas prone to channel erosion over the next 100 years. Areas within this CMZ that have been isolated by constructed features such as armor or floodplain dikes are attributed as "Restricted Migration Areas" (RMA). Beyond the CMZ boundaries, outlying areas that pose risks of channel avulsion are identified as "Avulsion Potential Zones".

LAND USE

Land uses were mapped from aerial photography Gardiner to the confluence of the Missouri River in North Dakota for four time periods: 1950s, 1976, 2001, and 2011. Mapping was performed at approximately 1:6,000 to ensure consistent mapping across all data sets. Typically, if a feature could not be easily mapped at the target mapping scale, it was not separated out from the adjacent land use.

A four-tiered system was used to allow analysis at a variety of levels. Tier 1 breaks land use into Agricultural and Non-Agricultural uses. Tier two subdivided uses into productive Agricultural Land and Infrastructure for the Agricultural land, and Urban, Exurban and Transportation categories for the Non-Agricultural land. Tier three further breaks down land uses into more refined categories such as Irrigated or Non-Irrigated and Residential, Commercial, or Industrial. Finally, Tier 4 focuses primarily on the productive agricultural lands, identifying the type of irrigation (Pivot, Sprinkler or Flood).

RIPARIAN

Riparian mapping data are derived from the Yellowstone River Riparian Vegetation Mapping study (DTM/AGI 2008). This study coarsely mapped the riparian vegetation communities using 1950's, 1976-1977, and 2001 aerial imagery in a GIS environment. The polygons are digitized at a scale of approximately 1:7,500, with a minimum mapping unit of approximately 10 acres. The goal of the delineation was to capture areas of similar vegetation structure as they appeared on the aerial imagery, while maintaining a consistent scale.

The "Riparian Turnover" values quantify the total area within the active channel area that converted from either woody vegetation to open bar or water, or from open bar or water to woody vegetation. A comparison of these values allows some consideration of overall riparian encroachment into the river corridor from 1950 to 2001.

Riparian Mapping

	Shrub (Acres)			Close	ed Timber (A	Acres)	Open Timber (Acres)

Riparian Turnover

Conversion of riparian areas to channel, or from channel to riparian between the 1950's and 2001 data set.

Riparian to Channel (acres) 81.5 Channel to Riparian (acres) 175.1

Riparian Encroachment (acres)

93.6

Riparian Recruitment

Creation of riparian areas between 1950s and 2001.

1950s Channel Mapped as 2011 Riparian (Ac) 179.3 1950s Floodplain Mapped as 2011 Channel (Ac) 13.2

> Total Recruitment (1950s to 2011)(Ac) 192.5

WETLANDS

Wetland areas were mapped to National Wetland Inventory standards by the Montana Natural Heritage Program. Palustrine wetlands within the mapped 100-year inundation boundary were extracted and summarized into four categories: Riverine (Unconsolidated Bottom - UB, Aquatic Bed -AB, and Unconsolidated Shore - US), Emergent - EM, Scrub-Shrub - SS, and Forested - FO.

	Riverine	Emergent	Scrub/Shrub	Forested	Total
Mapped Acres	3.8	112.2	9.6	0.0	125.6
Acres/Valley Mile	0.6	18.7	1.6	0.0	

RUSSIAN OLIVE

Russian olive is considered an invasive species and its presence in the Yellowstone River corridor is fairly recent. As such, its spread can be used as a general indicator of invasive plants within the corridor. It has the added benefit of being easily identified in multi-spectral aerial photography, making it possible to inventory large areas using remote techniques.

In 2011, Natural Resources Conservation Service (NRCS) in Bozeman, MT conducted an inventory of Russian olive locations in the Yellowstone River watershed. This study utilized the Feature Analyst extension within ArcGIS to interpret multi-spectral 2008 NAIP imagery for the presence of Russian olive. The resulting analysis was converted from raster format to a polygon ESRI shape file for distribution and further analysis within a GIS environment.

This work scope was tasked with integrating the resulting Russian olive inventory into the Yellowstone River Conservation Districts Council (YRCDC) Cumulative Effects Assessment (CEA) GIS and associated reach-based database. Additionally, analysis of Russian olive within the corridor was conducted to characterize its distribution in throughout the corridor and its association with other corridor data sets.

	Floodplain	% of	Other	Inside	Inside '50s	Inside 50s
	Area (Ac)	Floodplain	Area (Ac)	RMA (Ac)	Channel (Ac)	Island (Ac)

Yellowstone River Reach Narratives

FISHERIES SUMMARY

Fisheries data available for the Reach Narratives include low-flow and high-flow habitat mapping of 2001 conditions for 406 miles of river, extending from the mouth upstream to a point approximately 8 miles upstream of Park City. Habitat mapping was performed remotely on the 2001 CIR aerial photography utilizing habitat classifications developed by Montana Fish, Wildlife, and Parks (DTM 2009). Historic habitat mapping using the 1950's imagery is limited to Reach B1 (high-flow) and D9 (low and high-flow).

Fisheries field sampling data have been provided by Ann Marie Reinhold (MSU). In this study, the Yellowstone River from Park City to Sidney was divided into five segments. Within each segment, fish were sampled in reaches modified by riprap ("treatment reaches") and relatively unmodified reaches ("control reaches"). Fish sampling was conducted during summer and autumn of 2009, 2010, and 2011. Boat electrofishing, trammel nets, mini-fyke nets and bag seines were used to collect data from river bends.

Fish presence data is only presented for those reaches that were sampled.

The Low Flow Habitat Mapping followed schema deveoped by Montana Fish Wildlife and Parks to identify key habitat units for certain aquatic species.

Fish Species Observed in Reach/Region

•			
Region	Region	Region Reach	Region
■ Bigmouth buffalo	✓ Flathead chub	Northern redbelly dace	✓ Stonecat
✓ Black bullhead	✓ Freshwater drum	Pallid sturgeon	Sturgeon chub
☐ ☑ Black crappie	✓ Goldeye	✓ ✓ Pumpkinseed	✓ Sucker species
■ Blue sucker	✓ Green sunfish	Rainbow trout	Sunfish species
		✓ River carpsucker	✓ Walleye
✓ Brook stickleback	■ Largemouth bass		✓ Western silvery minnow
■ Brown trout	Longnose dace	✓ Sand shiner	
■ Burbot	✓ Longnose sucker	✓ Sauger	✓ White crappie
Catfish species	✓ Minnow species	✓ Shorthead redhorse	✓ White sucker
Channel catfish		Shortnose gar	✓ Yellow bullhead
✓ Common carp	✓ Mountain sucker	Shovelnose sturgeon	Yellow perch
✓ Creek chub	Mountain whitefish	Sicklefin chub	
✓ Emerald shiner		Smallmouth bass	

✓ ✓ Smallmouth buffalo

Low Flow Fisheries Habitat Mapping 2001 (Acres)

✓ ✓ Northern plains killifish

✓ ✓ Fathead minnow

Bankfull	Low Flow	% of Low Flow
118.7	58.2	7.7%
78.8	48.8	6.5%
182.1	138.0	18.3%
52.4	28.8	3.8%
56.3	67.3	8.9%
142.5	128.8	17.1%
	41.3	5.5%
	35.9	4.8%
	34.2	4.5%
122.7	131.6	17.5%
	40.6	5.4%
	118.7 78.8 182.1 52.4 56.3 142.5	118.7 58.2 78.8 48.8 182.1 138.0 52.4 28.8 56.3 67.3 142.5 128.8 41.3 35.9 34.2 122.7 131.6

AVIAN

Birds were sampled in 2006 and 2007 by Danielle Jones of Montana State University. Point count methods were used at 304 randomly chosen sites in 21 braided or anabranching reaches. Each site was visited multiple times within a season, and sites were visited in both years. Birds were sampled in grassland, shrubland, and cottonwood forest habitats. Additional bird data was collected by Amy Cilimburg of Montana Audubon in summer 2012. High priority areas for data collection were identified with the assistance of the YRCDC Technical Advisory Committee. The Audubon methodology recorded data for a wider variety of bird species relative to the MSU study, including raptors and waterfowl.

Bird	rd Species Observed in Reach/Region		Species of Concern	Potential Species of Concern	
Region Reach		Region	Region	Region	
V V	American Robin	☐ ✓ Chipping Sparrow	 ✓ Killdeer	✓ Song Sparrow	
	American Crow	☐ ✓ Clay-collared Sparrow	■ Lark Bunting	Spotted Sandpiper	
V V	American Goldfinch	✓ Cliff Swallow	✓ ✓ Lark Sparrow	✓ ✓ Spotted Towhee	
	American Kestrel	☐ ✓ Common Grackle	✓ ✓ Lazuli Bunting	Sharp-shinned Hawk Sharp-shinned	
V	American Redstart	☐ ✓ Common Merganser	✓ ✓ Least Flycatcher		
	Bald Eagle	☐ ✓ Common Nighthawk	■ Mallard		
	Baltimore Oriole	Common Raven	☐ ☐ Mountain Bluebird	✓ ✓ Tree Swallow	
	Barn Swallow	✓ Common Yellowthroat	✓ ✓ Mourning Dove	✓ Turkey Vulture	
V V	Belted Kingfisher	□ ✓ Cooper's Hawk	✓ ✓ Northern Flicker	Upland Sandpiper	
	Black-billed Cuckoo	□ ✓ Dickcissel	☐ ✓ Orchard Oriole		
	Black-billed Magpie	Downy Woodpecker	☐ Osprey		
V V	Black-capped Chickadee	■ Eastern Bluebird	✓ ✓ Ovenbird	✓ Warbling Vireo	
	Black-and-white Warbler	✓ ✓ Eastern Kingbird	■ Plumbeous Vireo	✓ ✓ Western Kingbird	
	Black-headed Grosbeak	■ Eurasian Collared-dove	□ ✓ Red-headed Woodpecker	✓ Western Meadowlark	
V V	Blue Jay	✓ ✓ European Starling	Red-naped Sapsucker	✓ ✓ Western Wood-pewee	
	Bobolink	☐ ✓ Field Sparrow	✓ ✓ Red Crossbill		
	Brewer's Blackbird	☐ ✓ Franklin's Gull	✓ ✓ Ring-necked Pheasant	White-throated Swift White-throat	
V V	Brown-headed Cowbird	☐ ✓ Grasshopper Sparrow	✓ Red-tailed hawk	Wild Turkey	
	Brown Creeper	Gray Catbird		✓ ✓ Wood Duck	
	Brown Thrasher	☐ ✓ Great Blue Heron		Yellow-bellied Sapsucker	
V	Bullock's Oriole	☐ ✓ Great Horned Owl	✓ ✓ Red-eyed Vireo	Yellow-billed Cuckoo	
	Canada Goose	☐ ✓ Hairy Woodpecker	Red-breasted Grosbeak	✓ Yellow-breasted Chat	
V V	Cedar Waxwing	House Finch	✓ ✓ Say's Phoebe	Yellow-headed Blackbird	
V	Chimney Swift	✓ ✓ House Wren	☐ ✓ Savannah Sparrow	✓ Yellow Warbler

Reach C8

CULTURAL INVENTORY SUMMARY

The Yellowstone River Cultural Inventory - 2006 documents the variety and intensity of different perspectives and values held by people who share the Yellowstone River. Between May and November of 2006, a total of 313 individuals participated in the study. They represented agricultural, civic, recreational, or residential interest groups. Also, individuals from the Crow and the Northern Cheyenne tribes were included.

There are three particular goals associated with the investigation. The first goal is to document how the people of the Yellowstone River describe the physical character of the river and how they think the physical processes, such as floods and erosion, should be managed. Within this goal, efforts have been made to document participants' views regarding the many different bank stabilization techniques employed by landowners. The second goal is to document the degree to which the riparian zone associated with the river is recognized and valued by the participants. The third goal is to document concerns regarding the management of the river's resources. Special attention is given to the ways in which residents from diverse geographical settings and diverse interest groups view river management and uses. The results illustrate the commonalities of thought and the complexities of concerns expressed by those who share the resources of the Yellowstone River.

Summary of Cultural Views in Region C

In the study segment, Powder River to Big Horn River, three conversations emerged across the four interest groups. The first conversation focuses on the "familiar way of life." The conversation exposes a local identity that is tied to agriculture and to traditional forms of recreation, such as hunting and fishing. When asked if the familiar management practices are sufficient in terms of sharing the river's resources, some locals express concerns. The second conversation explicitly acknowledges that the demand for recreational access to the river's resources is in its infancy in terms of representing a problem. The third conversation focuses on controlling the river with rip-rap and dikes.
